

COURSERA FINAL PROJECT  
SPECIALIZED MODELS: TIME SERIES AND SURVIVAL ANALYSIS

# Time Series Forecasting to predict grocery sales at Favorita stores

Project presented by  
**Raziel Amador Rios**  
to obtain the Coursera Certificate

**Main object:** produce a reliable forecasting based on sales time-series data from a retail store (Favorita stores, an Ecuadorian-based company).

**Barcelona, January 2023**

# Time Series Forecasting

# I

---

## Main objective

The **main object** of the project is to generate a reliable **time series forecasting** based on sales from Favorita stores, which is a grocery retail store based in Ecuador. Producing an accurate forecast could lead to decreased food waste related to overstocking and improve customer satisfaction.

All the code can be found in the following [GitHub repository](#), further information can be found in Supplementary information.

## II

### Data description

The dataset comes from **Kaggle**, named: [Store Sales - Time Series Forecasting](#). The Kaggle dataset contains sales data from *Corporación Favorita*, a large Ecuadorian-based grocery retailer. Kaggle provides you with 7 different files (see Table 1 for more details).

Number	File Name	Description
1	holiday_events.csv	Relevant holidays in Ecuador
2	oil.csv	Oil prices from 2013 to 2017
3	sample_submission.csv	submission example
4	stores.csv	Stores metadata
5	test.csv	Stores and family products
6	train.csv	Sales by store and product-family from 2013-01 to 2017-08
7	transactions.csv	Number of transactions by store

**Table 1: Kaggle files description.** Files are alphabetically sorted.

The training data represents 99% of the data, including dates from 2013-01-01 to 2017-08-16 (55.5 months), 54 stores placed in different cities within Ecuador, and 33 family-products (see Figure 1). The testing data includes dates from 2017-08-16 to 2017-08-31 (15 days).

Stores Summary					
<b>54</b>	<b>5</b>	<b>17</b>	<b>33</b>	<b>16</b>	<b>55.5</b>
Stores	Store types	Store clusters	Product families	States	Months

**Figure 1: Summary of the training dataset.** The cluster information denotes similarity between stores.

# III

## Data exploration and data cleaning

Performing an exploratory data analysis (eda) of the sales from the training dataset, we can observe that grocery I, beverages, and produce are the top 3 most consumed products (see Figure 3) . Additionally, store type A, and cluster 5 are the most frequent among their classification.

**Figure 2: EDA of sales.** The plot describes the sales by product, store type, and per cluster (left, right, and below, respectively). Darker blue represents higher sales.

### III.1. Stationarity and seasonality analyses

**Figure 3: EDA of sales.** The plot describes the sales by product, store type, and per cluster (left, right, and below, respectively). Darker blue represents higher sales.
